

## Lab Assignment: HOG Feature Extraction and Analysis

**Objective:** The objective of this lab is to understand the process of extracting Histogram of Oriented Gradients (HOG) features from an image. You will experiment with different parameters such as cell size and block size to observe their effect on HOG features. Additionally, you will apply HOG feature extraction on different types of images and reflect on the results.

### Instructions:

#### Part 1: HOG Feature Extraction on Your Own Image

1. Use your own image as input for the HOG feature extraction. Replace test.jpg in the given code with the path to your personal image.
2. Run the provided code to calculate the HOG features.
3. Observe the output and save the visualization of the following:
  - Gamma-normalized image
  - Gradient Magnitude of the image
  - Gradient orientation visualization using quiver
  - HOG features visualization for the dominant orientation per cell
4. Save the results in a PDF format for submission.

#### Part 2: Experiment with HOG Parameters

1. Modify the cell\_size and block\_size parameters in the provided code and observe how the changes affect the resulting HOG features.
2. Run the code using the following parameter values:
  - **Cell size:** 8x8 pixels, **Block size:** 2x2 cells
  - **Cell size:** 16x16 pixels, **Block size:** 2x2 cells
3. Answer the following questions in your reflection:
  - How does changing the cell size and block size affect the HOG visualization?
  - Which cell size and block size provide the most visually distinguishable features?
4. Include the HOG visualization results from each parameter setting in your PDF submission.

PTO

### Part 3: HOG Feature Extraction on a Car or Truck Image

1. Obtain an image of a car or a truck and use it as input for the HOG feature extraction.
2. Use the original cell\_size of 4x4 and block\_size of 2x2 to calculate the HOG features for the car/truck image.
3. Save the following visualizations for your report:
4.
  - o Gamma-normalized image of the car/truck
  - o Gradient magnitude and gradient orientation visualization
  - o HOG features visualization for the dominant orientation per cell
5. Write a reflection discussing the differences in the HOG feature representation of the car/truck image compared to your own face image.

#### Submission Requirements:

- A single PDF document containing:
  - o Visualizations from each task.
  - o Reflections on changing parameters and comparing different types of images.
- Answer the following questions in your reflection:
  1. What effect did changing the cell\_size and block\_size parameters have on the HOG features?
  2. How did the HOG features of your face compare to those of a car/truck?
  3. Which parameter settings do you think would work best for distinguishing between different types of images?

#### Optional Challenge:

- Try using a different gamma value for normalization (e.g., gamma = 0.5 or gamma = 1.5). How does this impact the visualization of gradient magnitude and HOG features? Include these observations in your PDF.

#### Evaluation Criteria:

- Correct implementation of HOG feature extraction.
- Clarity and completeness of your PDF submission.

Make sure to experiment and reflect on your results! The more insights you gain, the better your understanding of HOG feature extraction will be.
