# CT 420 Real-Time Systems

## Logging, Debugging and Visualization of QUIC Traffic

Dr. Jawad Manzoor  
Assistant Professor  
School of Computer Science

University  
ofGalway.ie

# Contents

OLLSCOIL NA GAILLIMHÉ  
UNIVERSITY OF GALWAY

- ❑ Traffic Analysis using Wireshark
- ❑ qlog and qviz
- ❑ Visualization Case Studies

# Motivation

- ❑ There are many things that can go wrong during network communication that can lead to sub-optimal performance of your web application.
- ❑ Logging, debugging and visualizations are used to analyze the protocols and find root cause of the problems.
- ❑ For TCP, the most commonly used method is packet capture.
  - Analyze pcap files in Wireshark
- ❑ For QUIC, newer methods are developed recently.
  - qlog
  - qviz

# Case Study 1

- ❑ Client experiencing slower speeds on QUIC as compared to TCP.
  - Analyze the network traffic to find the root cause.
  - Use cURL to download the webpage and capture the network traffic
  
- ❑ cURL is a command line tool that developers use to transfer data to and from a server.
  - It is compatible with almost every operating system and connected device.
  - It is useful for testing endpoints.
  - It has HTTP3 support

# Demo

## □ Prerequisites

- Install docker desktop
- Get curl-http3 docker file from the GitHub repo
- <https://github.com/rmarx/curl-http3>
- Build docker image

- Runs a container in interactive mode (-it).
- Mounts a directory (pcaps\_on\_host) on the host to /srv in the container.
- Logs QUIC events (qlog) to /srv.
- Logs TLS keys to /srv/tls\_keys.txt for decrypting HTTPS traffic.

```
docker run -it --rm
  --volume $(pwd)/pcaps_on_host:/srv
  --env QLOGDIR=/srv
  --env SSLKEYLOGFILE=/srv/tls_keys.txt
```

```
rmarx/curl-http3
```

- Captures HTTP/3 (QUIC) network traffic for analysis.
- The .pcap file can be opened in Wireshark to inspect HTTP/3 behavior.
- Useful for debugging HTTP/3 connectivity issues.

```
bash -c "tcpdump -w /srv/packets.pcap -i eth0 & sleep 1; curl -IL
https://www.sre.com --http3;
sleep 2; pkill tcpdump; sleep 2"
```

# Why limit response to 3x?

- To prevent UDP reflection / amplification attack

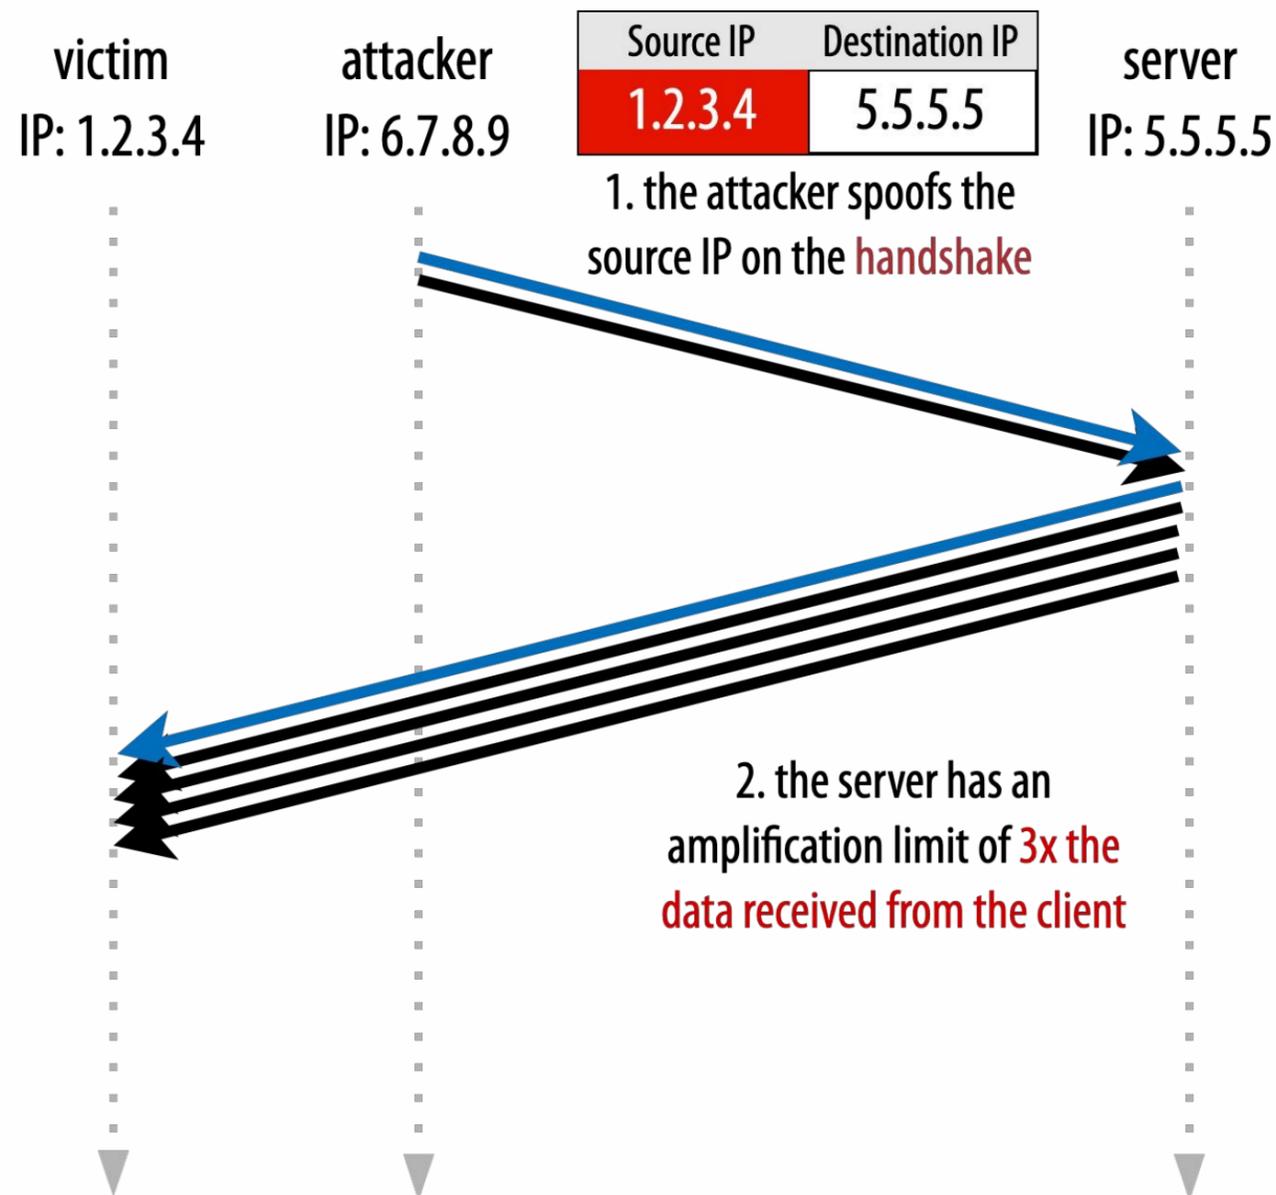

Memcached: **51000x** amplification

<https://blog.cloudflare.com/memcrashed-major-amplification-attacks-from-port-11211>

# Impact of 3x limit

## Benefit

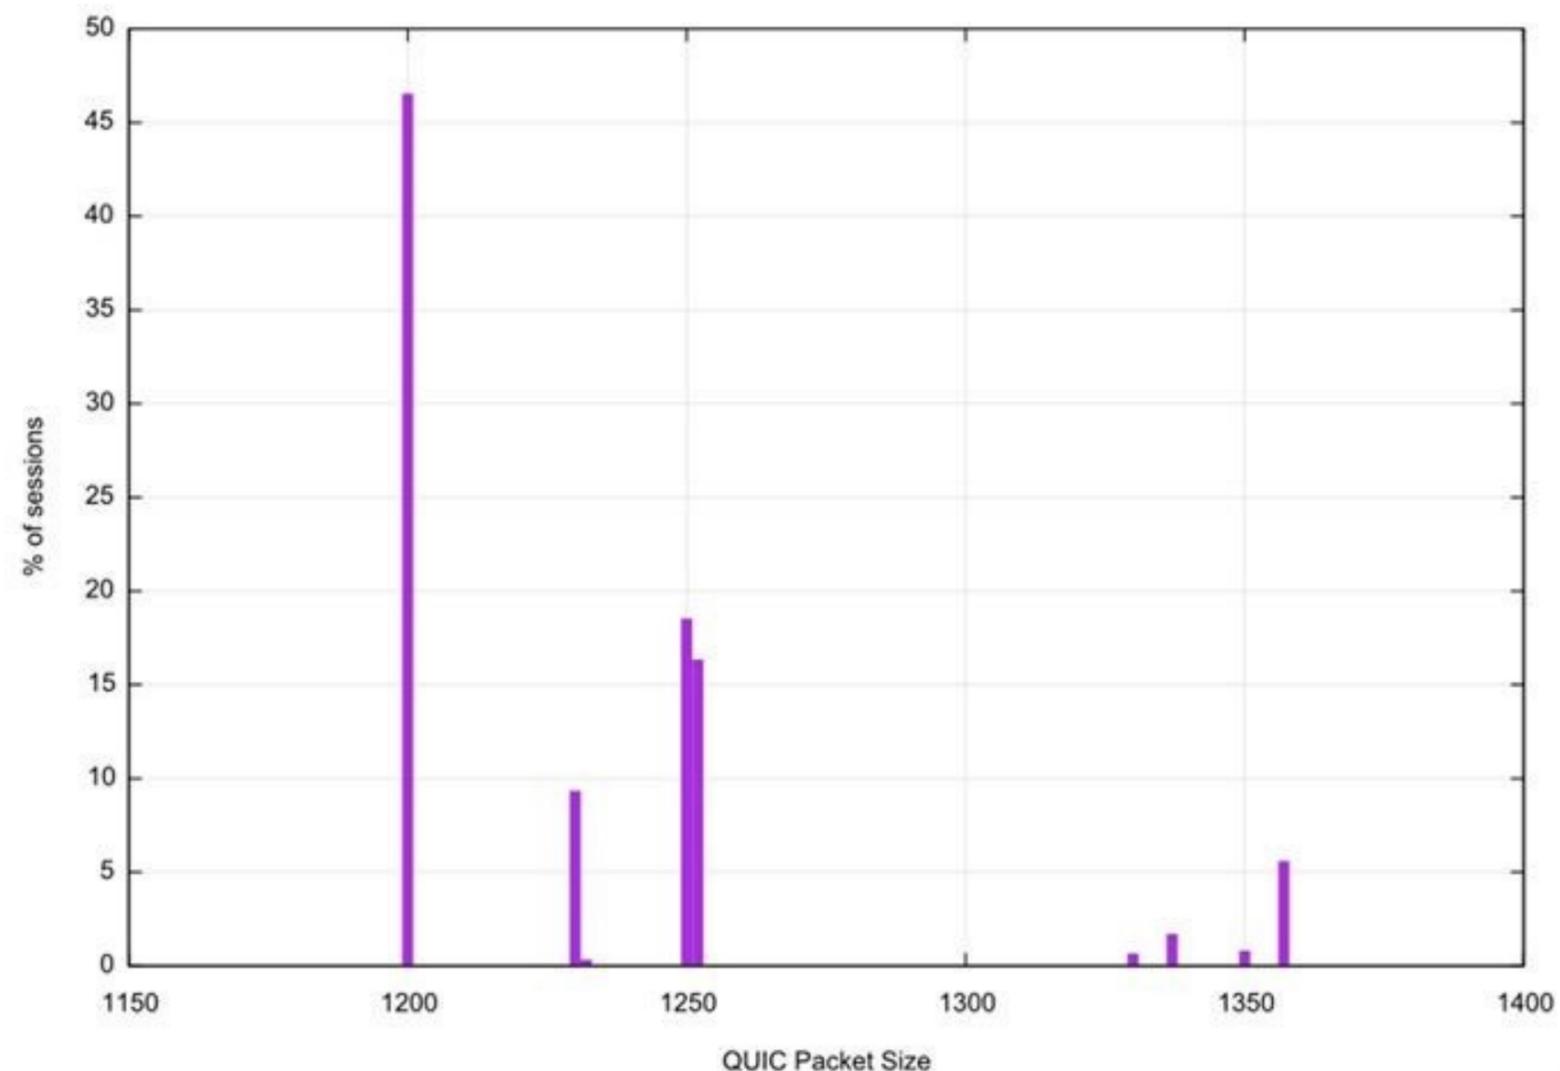

## Drawback

- TLS certificate size can sometimes be over the 3x limit
- Multiple round trips are required to complete the handshake
- Large TLS certificates impede QUIC performance

# Countermeasures

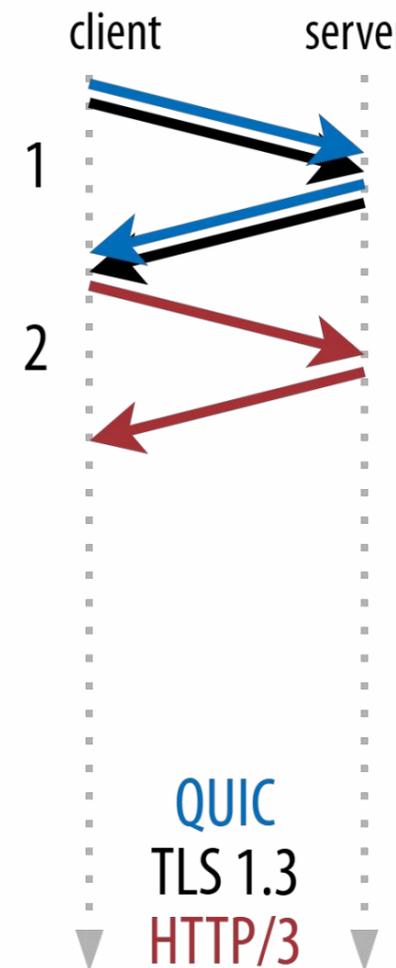

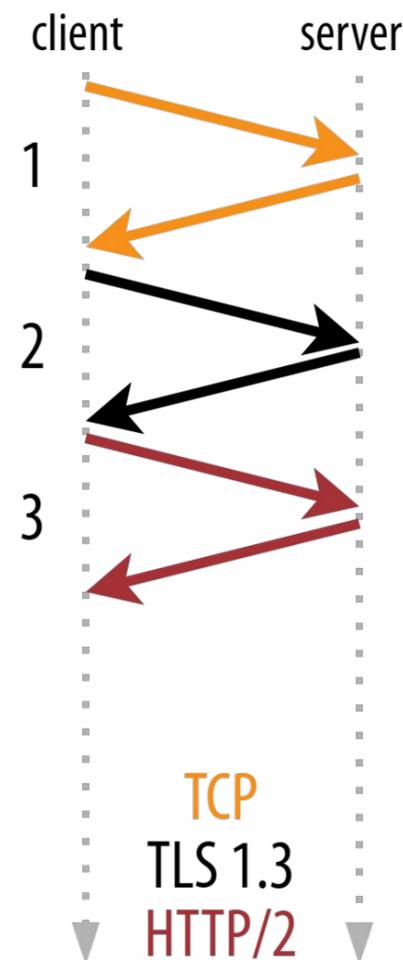

- ❑ cURL uses initial packet size of 1240 bytes
- ❑ Different clients use different sizes, so the performance can vary.
- ❑ Many deployments ignore 3X and go to 4, 5 or 6X to get handshake done in 1 RTT

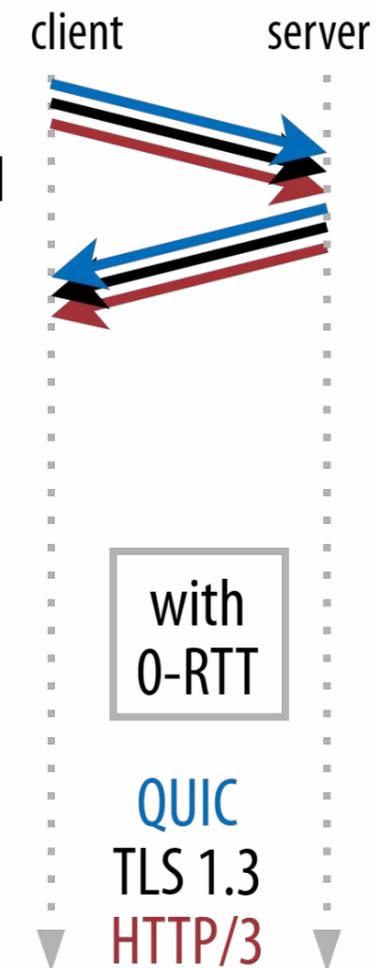

# Case Study 2

- A research experiment shows HTTP/3 is around 50% faster than HTTP/2 in Time To First Byte(TTFB), but it should be 33% (or 66% if using 0-RTT)

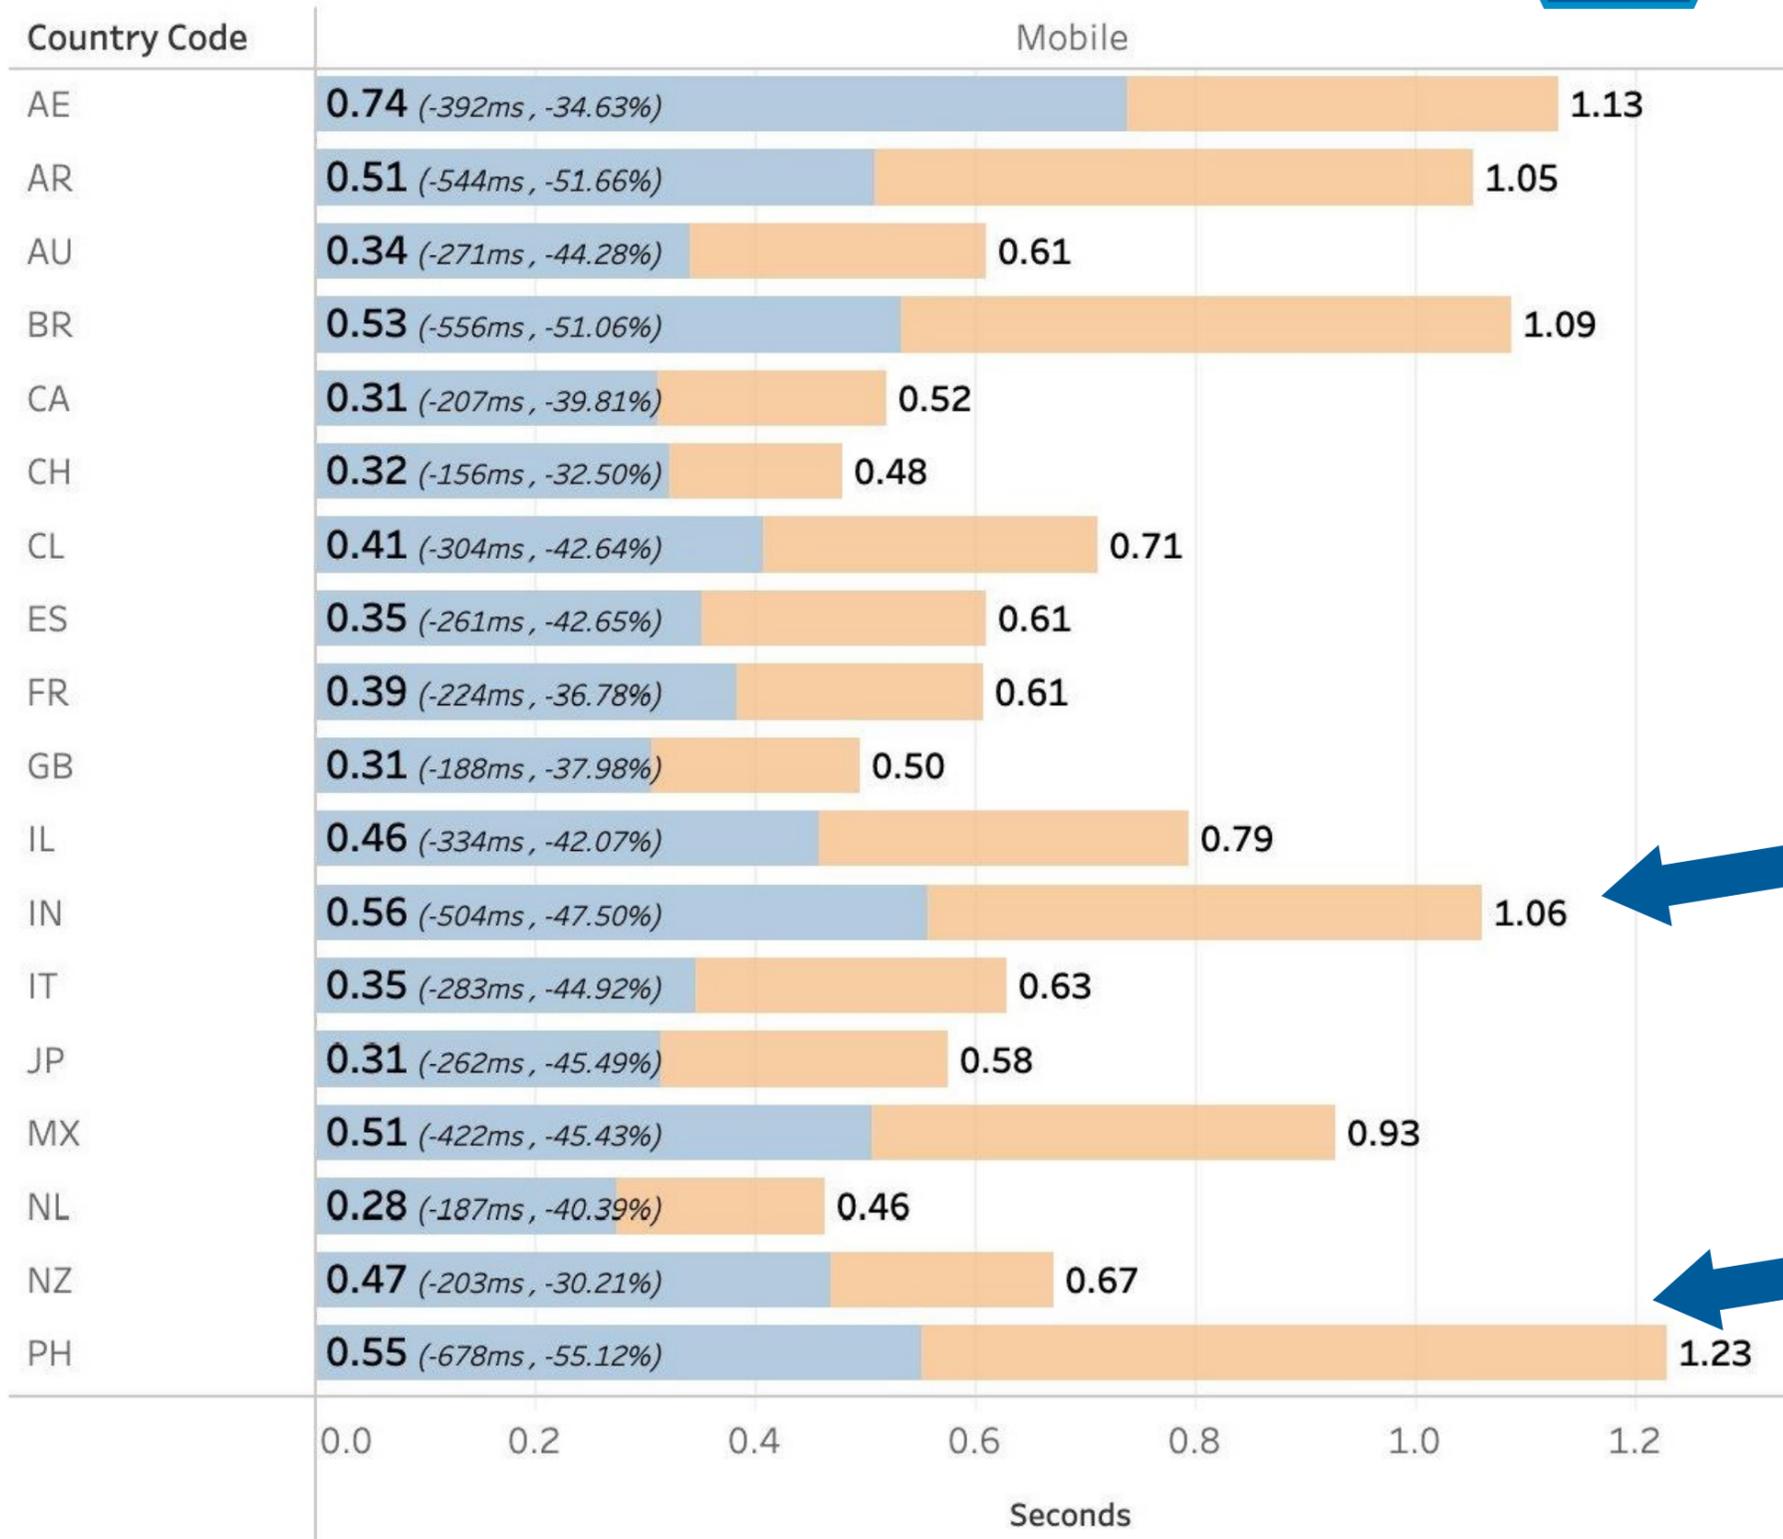

~33%  
faster

~66%  
faster

Yet we see  
~50%?

# Time to First Byte

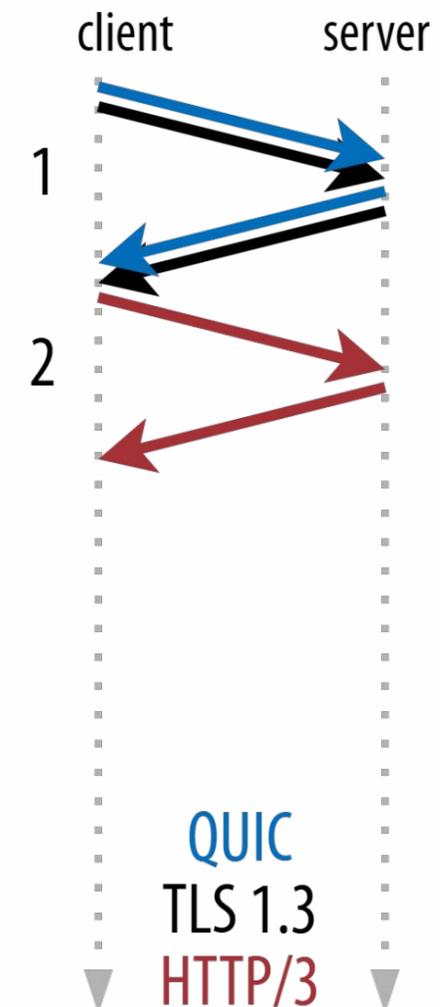

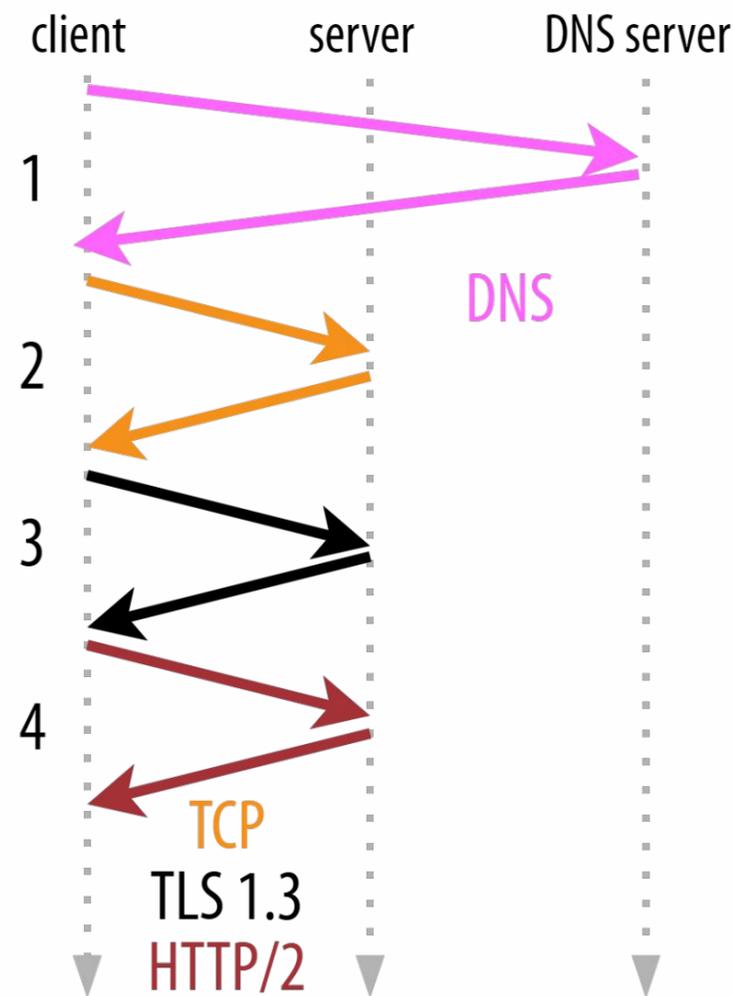

**India:**  
47.50% faster!  
1000ms vs 560ms!

**Philippines:**  
55% faster!  
1230ms vs 550ms!

# Traffic Analysis

- ❑ To find the root cause we capture traffic and analyze it
- ❑ Through traffic analysis we discover that DNS time is included in HTTP2
- ❑ But why is DNS time not present in HTTP3?

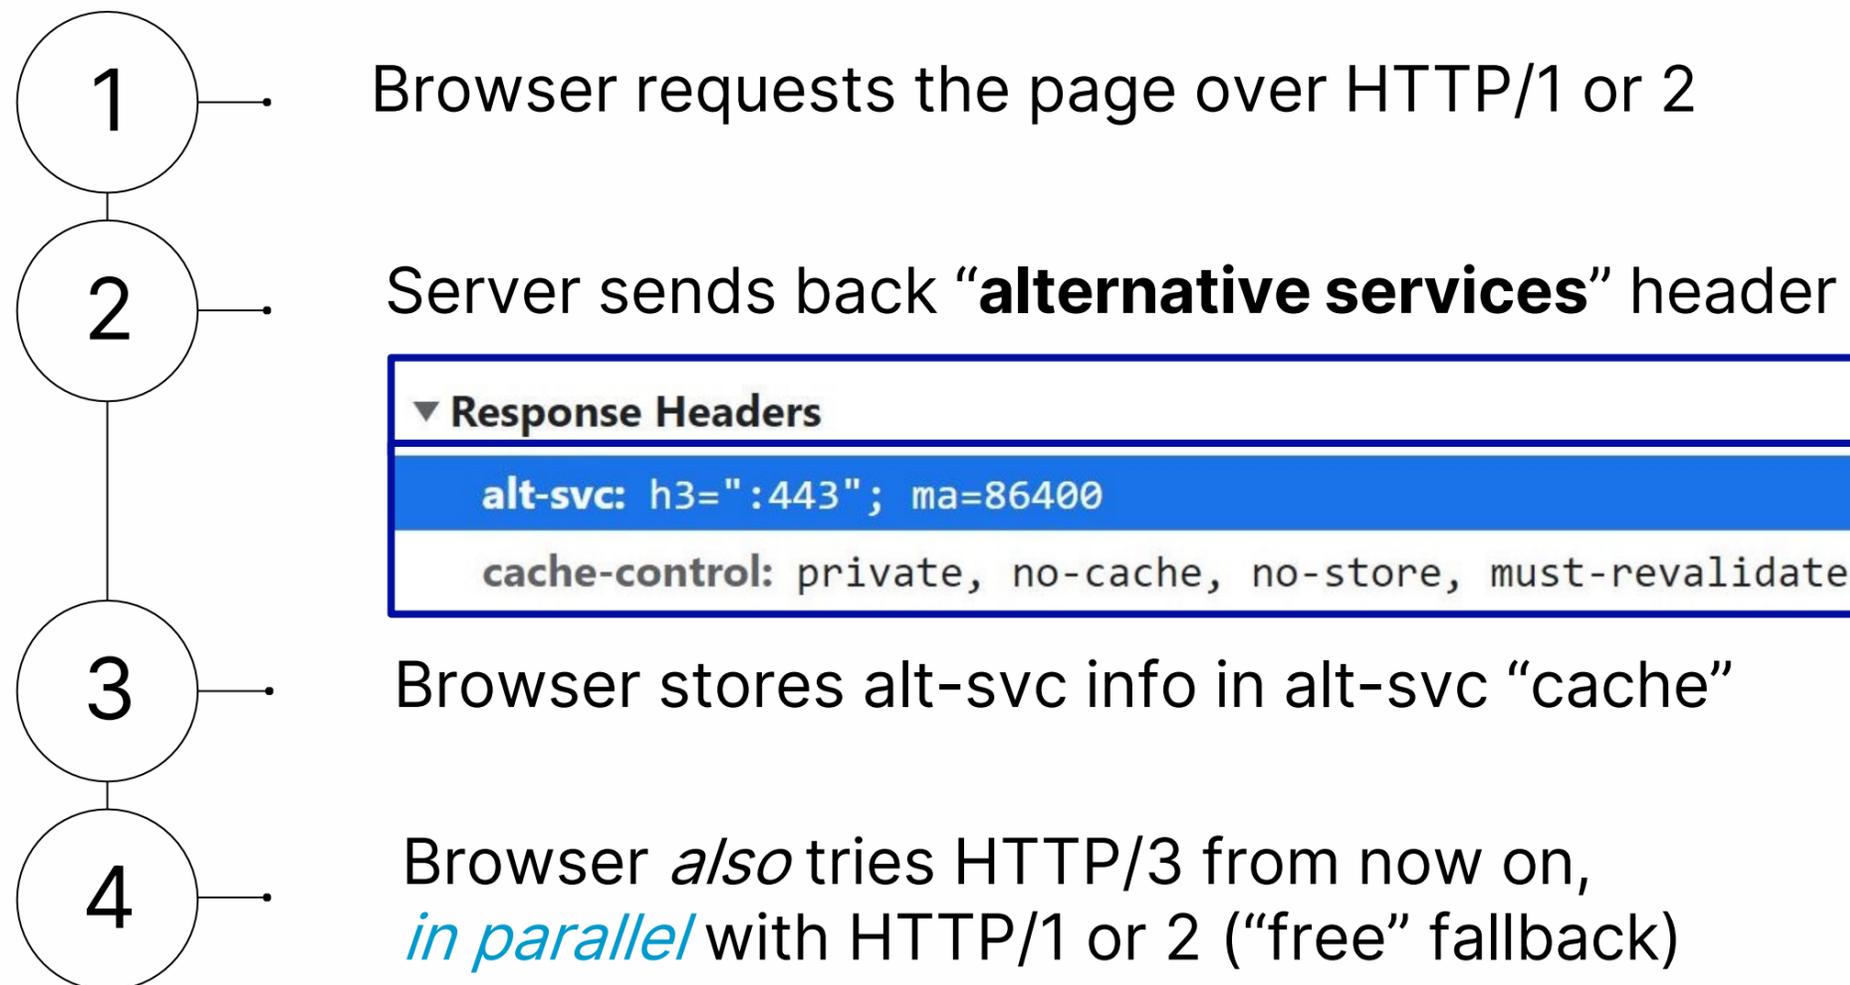

= unfair comparison

~50% faster

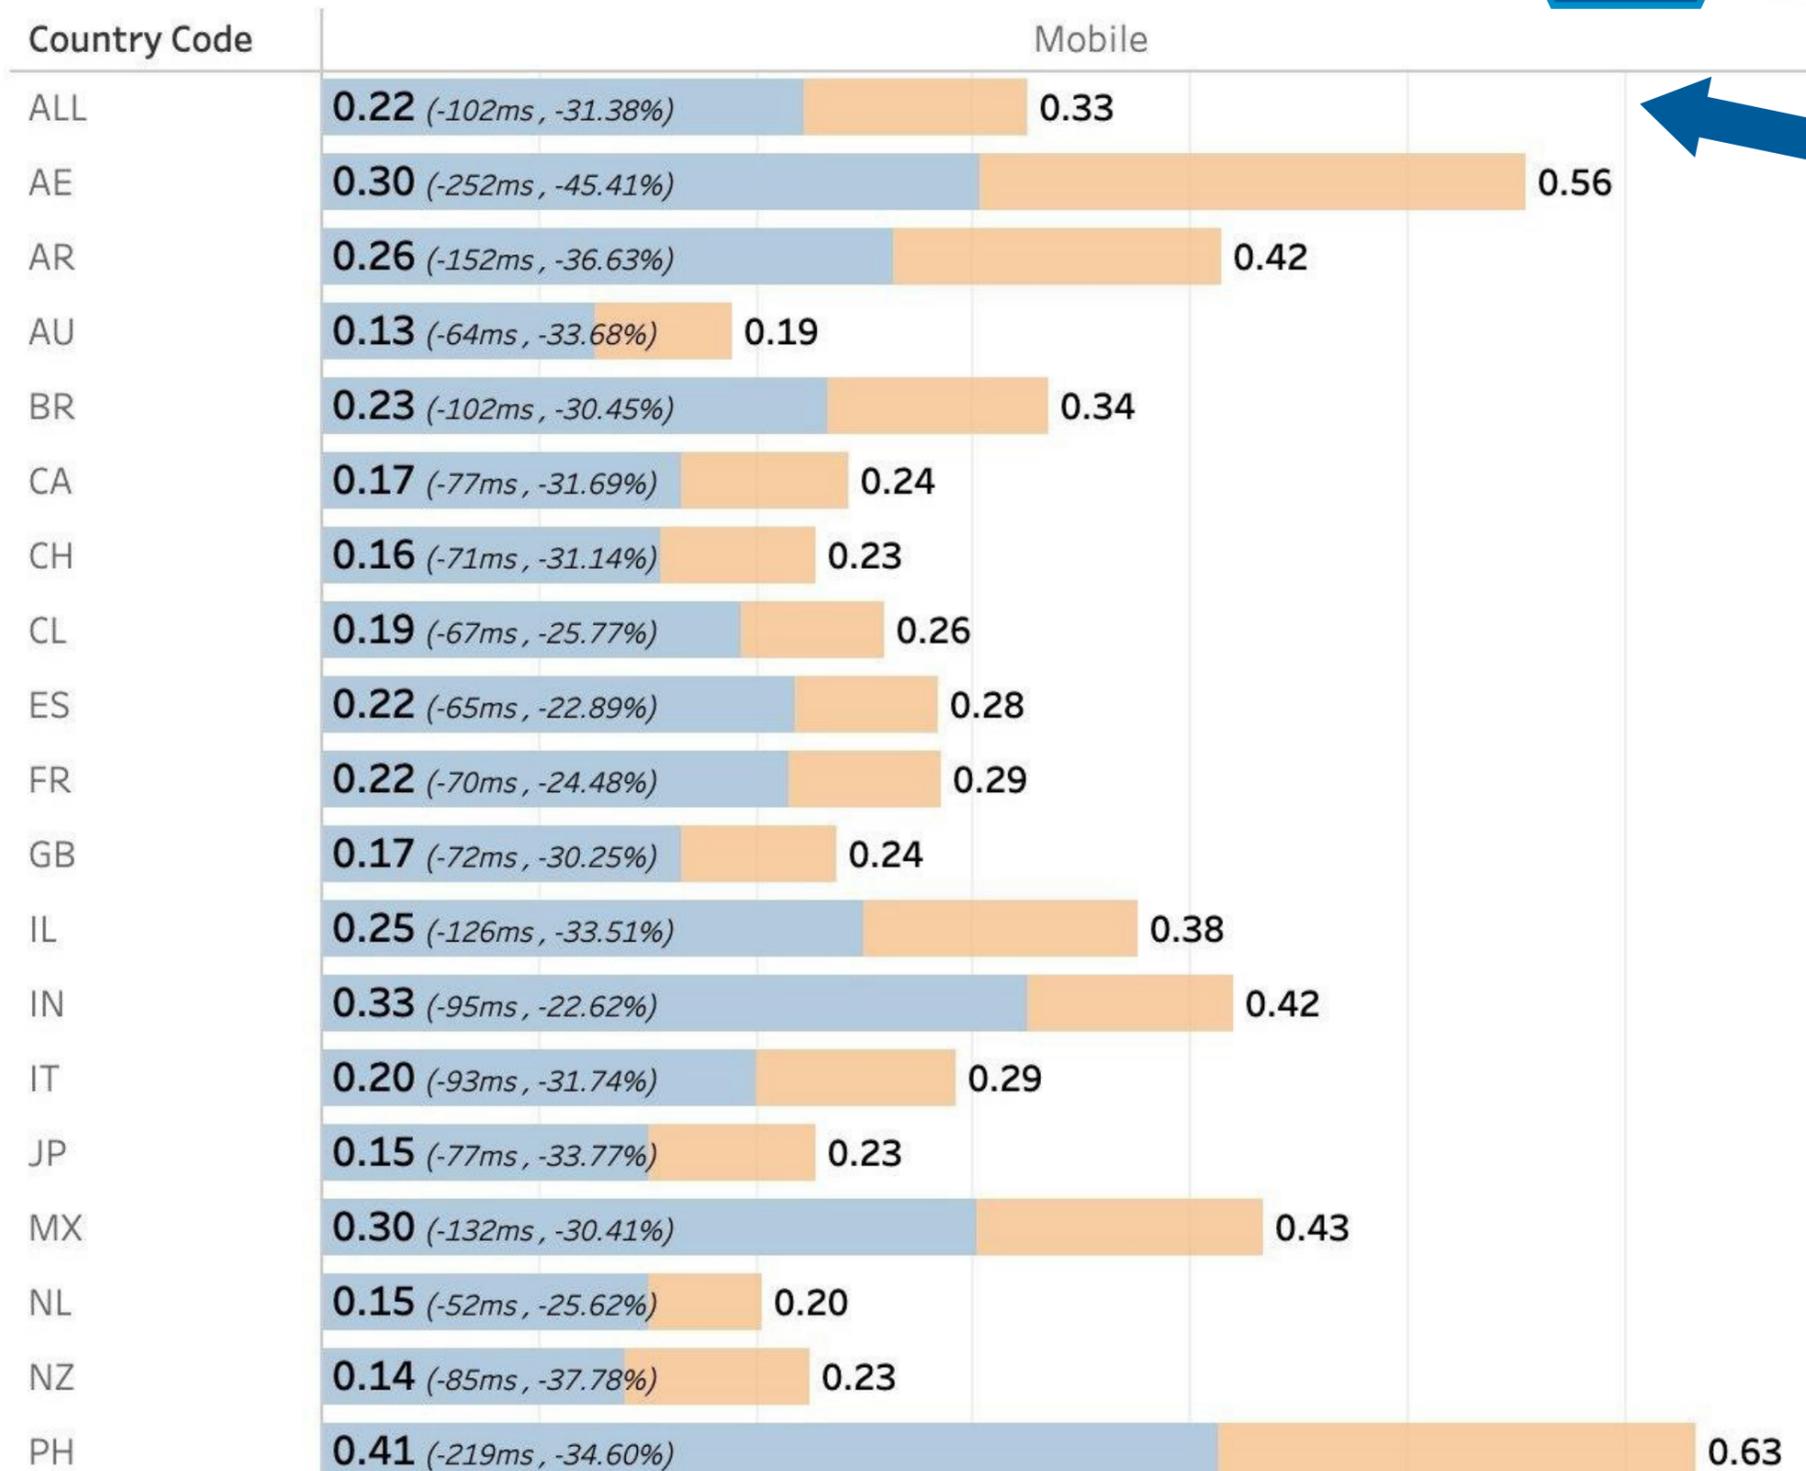

# Browser only do HTTP/3 after *discovery*

- ❑ When talking to a new domain, the browser does not start with HTTP3 because its not sure if the server supports it
- ❑ For a new hostname browser performs the following:

# P75 Time to First Byte

Mean:  
31% faster! 330ms  
vs 220ms!

Philippines:  
34% faster! 630ms  
vs 410ms!

# Why do we need other tools

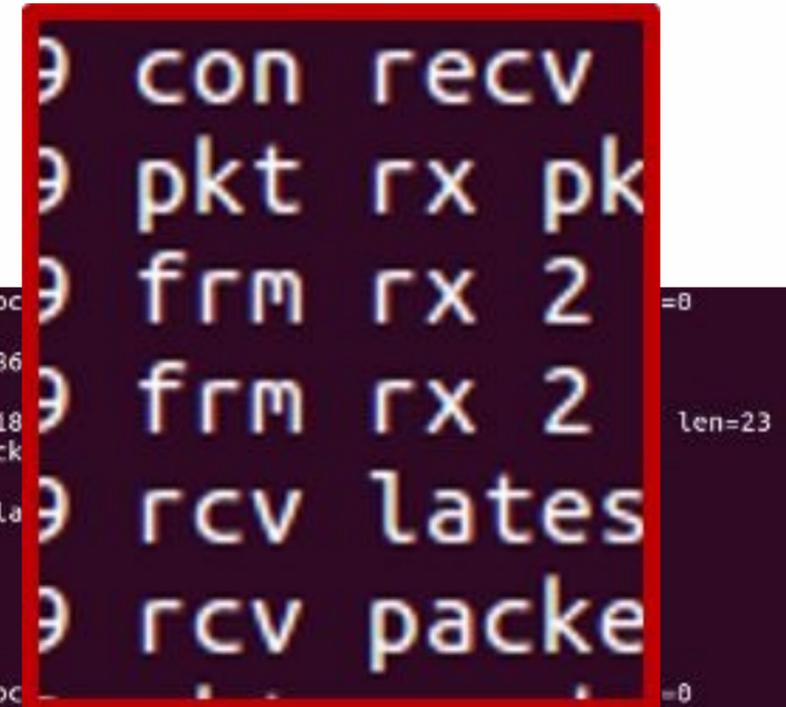

## □ Why can't we just use Wireshark?

- QUIC is heavily encrypted and very little information is visible in Wireshark without decryption keys
- Don't always have TLS decryption keys.
- A lot of core performance information is not sent on the wire, it is only available at the end points
- Some features not fully supported
  - HTTP/3 QPACK header decoding was added just a few months ago.
- Wireshark JSON/XML output isn't easy to use by default.
- Wire image does not contain all info
  - Internal state information is missing, e.g. no congestion window

# Log Information

- ❑ There is a lot of useful information in the application log
- ❑ However, parsing random application logs is not fun!
- ❑ A standard format is needed!

```

# [qlog]

- ❑ Structured endpoint logs
- ❑ Log metadata and state in the endpoints (client and server) in the QUIC implementations.
- ❑ qlog is a schema for JSON describing QUIC events
- ❑ Each qlog event is defined by a timestamp, a category (e.g., “transport”), an event type (e.g., “packet\_sent”) and some type specific data (e.g., the size of the sent packet and its header fields).
- ❑ qlog is flexible
  - New event categories, types and metadata can trivially be added, modified and extended

# [qlog]

## □ qlog examples

```
{
  "time": 15000,
  "name": "transport:packet_received",
  "data": {
    "header": {
      "packet_type": "1rtt",
      "packet_number": 25
    },
    "frames": [
      {
        "frame_type": "ack",
        "acked_ranges": [
          [10,15],
          [17,20]
        ]
      }
    ]
  }
}
```

```
{
  "time": 15001,
  "name": "recovery:metrics_updated",
  "data": {
    "min_rtt": 25,
    "smoothed_rtt": 30,
    "latest_rtt": 25,

    "congestion_window": 60,
    "bytes_in_flight": 77000,
  }
}
```

# qlog adoption

>70% of QUIC implementations have (partial) support:

- aioquic
- quic-go
- quiche
- mvfst
- picoquic
- haskell
- ngtcp2
- ...

Others do something similar:

- msquic
- google quiche

Facebook has deployed it in production

Store over **30 billion** qlog events daily

IETF standardization in-progress

<https://datatracker.ietf.org/doc/html/draft-ietf-quic-qlog-main-schema-11>

- ❑ qviz is open-source toolsuite that can directly ingest and visualize qlog files
- ❑ It provide a number of tools:
  - Sequence diagram
  - High-level statistics overview
  - Congestion control
  - Multiplexing
  - Packetization

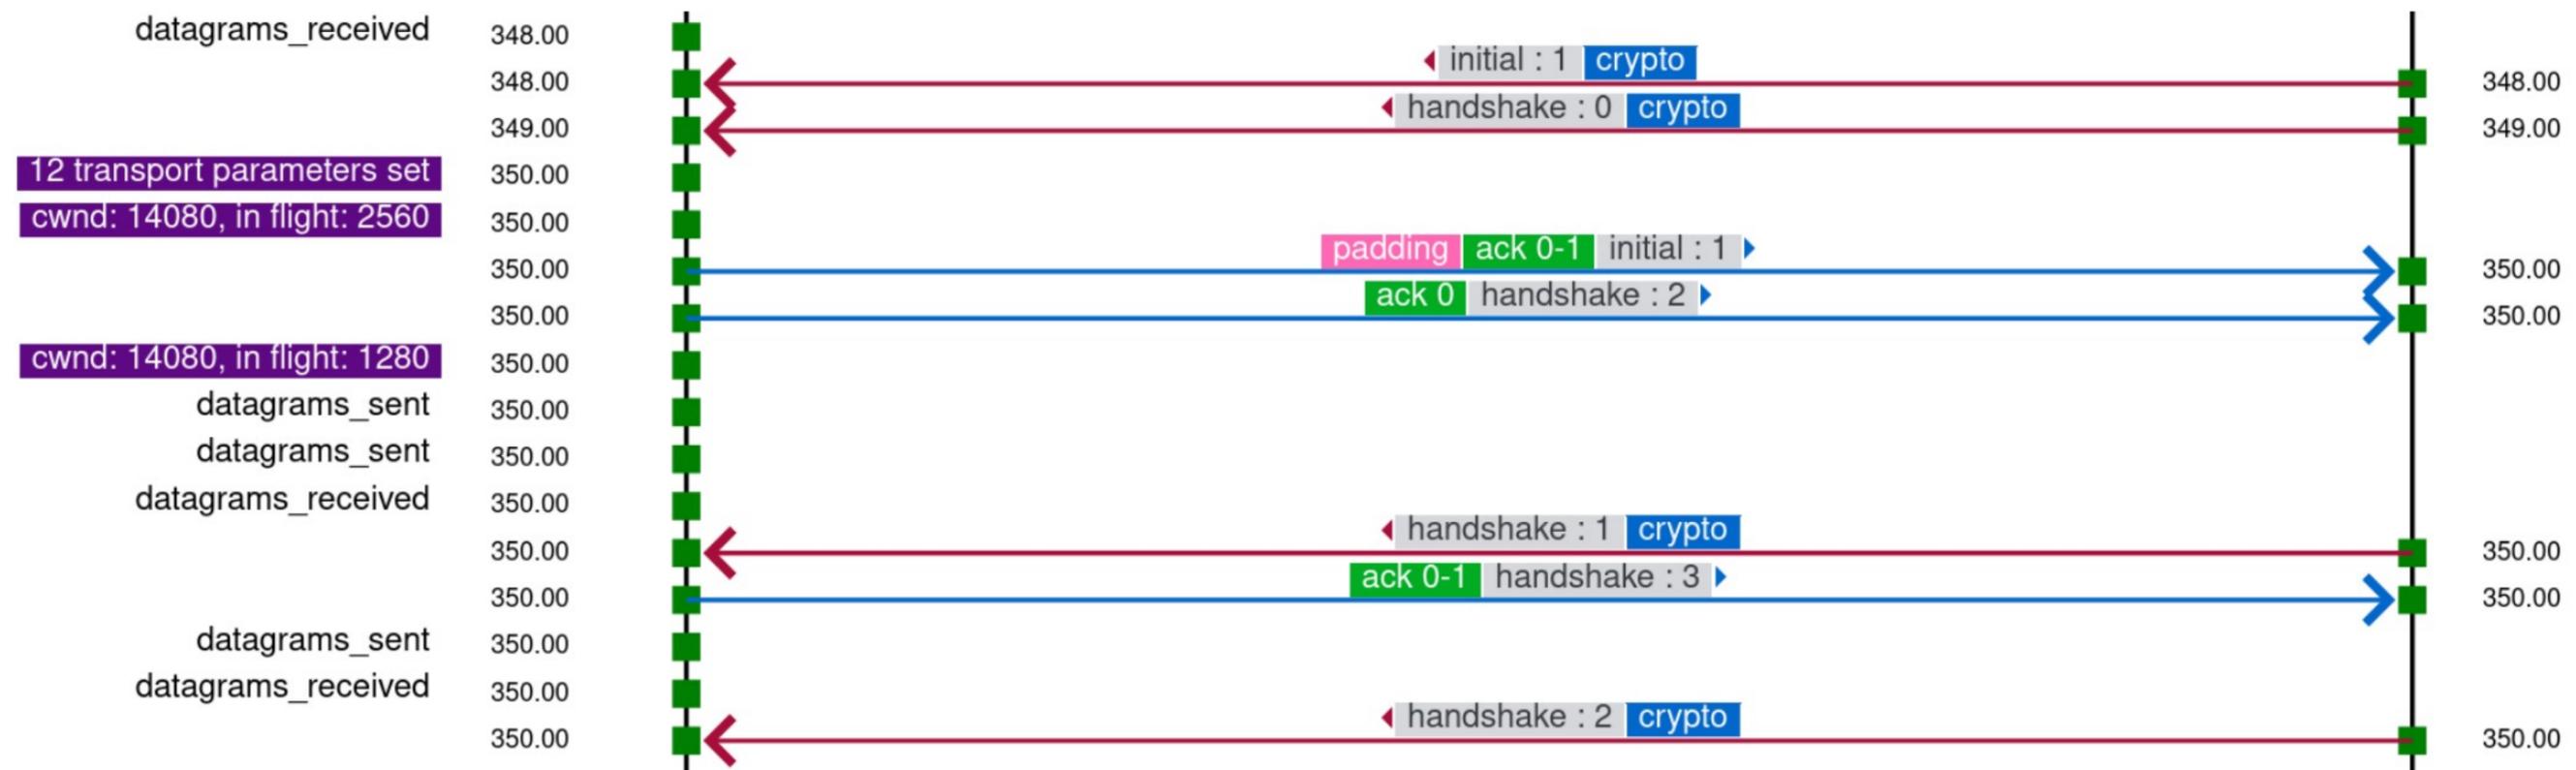

OLLSCOIL NA GAILLIMHÉ  
UNIVERSITY OF GALWAY

# Visualization Case Studies

# Sequence Diagram

- ❑ The sequence tool generates a sequence diagram.
- ❑ The green squares on both sides represent events.
- ❑ All the green boxes, event names and packet information can be clicked which brings up the corresponding qlog file in plaintext, allowing for further, more detailed packet inspection

# Stream Multiplexing and Prioritization

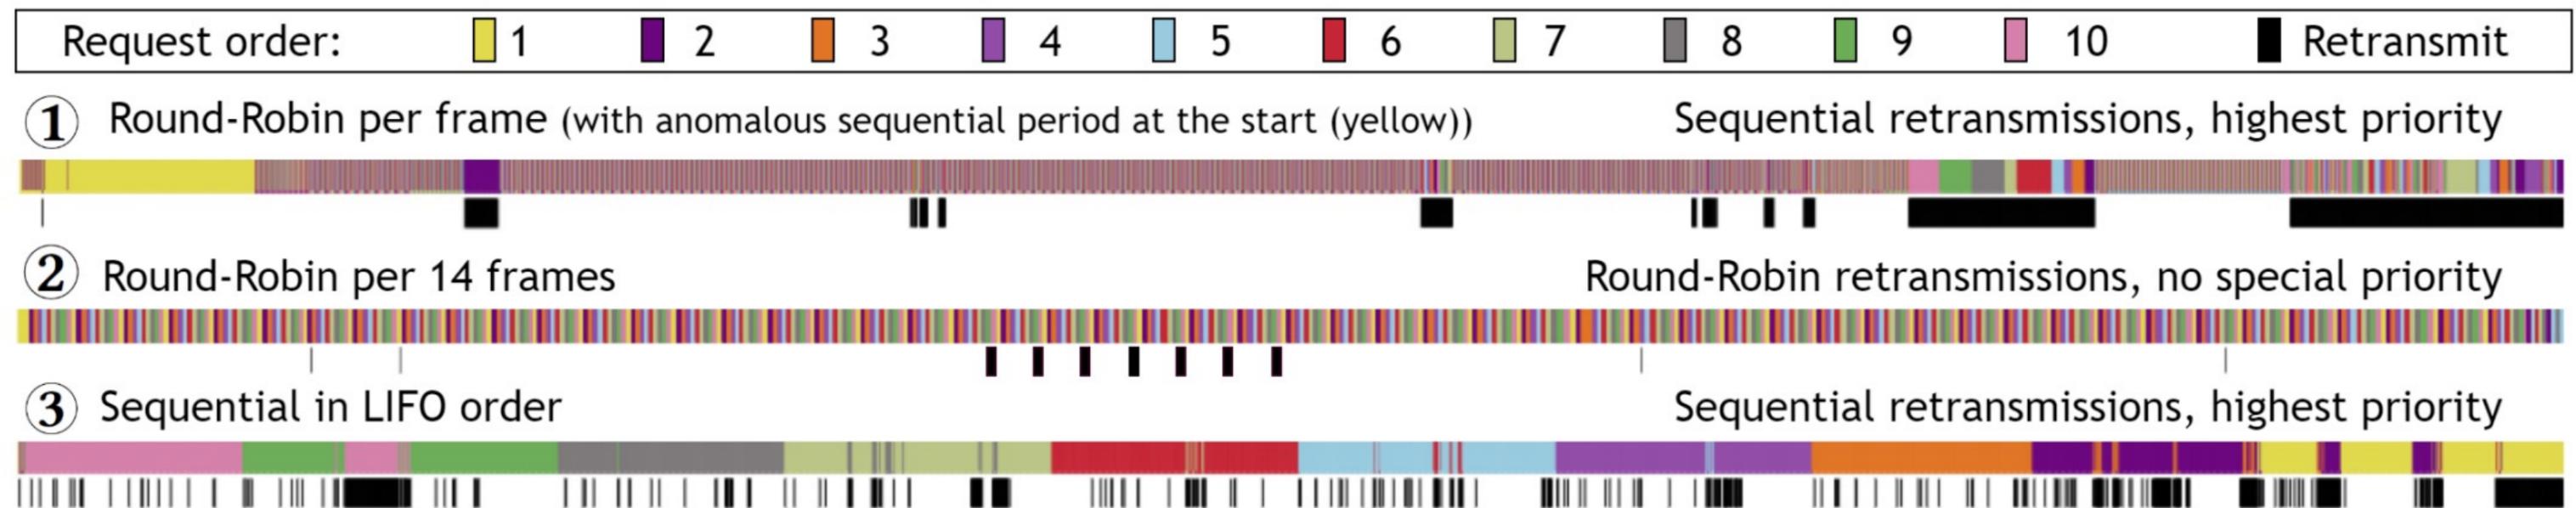

OLLSCOIL NA GAILLIMHE  
UNIVERSITY OF GALWAY

- ❑ Modern protocol stacks often multiplex data from several parallel “streams” onto one connection (e.g., HTML, CSS and image files when loading a web page).
- ❑ This multiplexing can happen in various ways
- ❑ (e.g., files are sent sequentially as a whole or are scheduled via Round-Robin (RR) after being subdivided in chunks) and is typically steered using a prioritization system
- ❑ qvis multiplexing diagram can be used to verify and debug an implementation.
- ❑ It shows the response payload carrying frames, displayed on a horizontal line with different colors to distinguish the stream each frame belongs to.

# Stream Multiplexing and Prioritization

- This example shows multiplexing behavior across three different QUIC stacks when downloading 10 MB files in parallel
  - Each small colored rectangle is one payload frame belonging to a file.
  - Black areas indicate which frames above them contain retransmitted data.
  - Data arrives from left to right.

# Stream Multiplexing and Prioritization

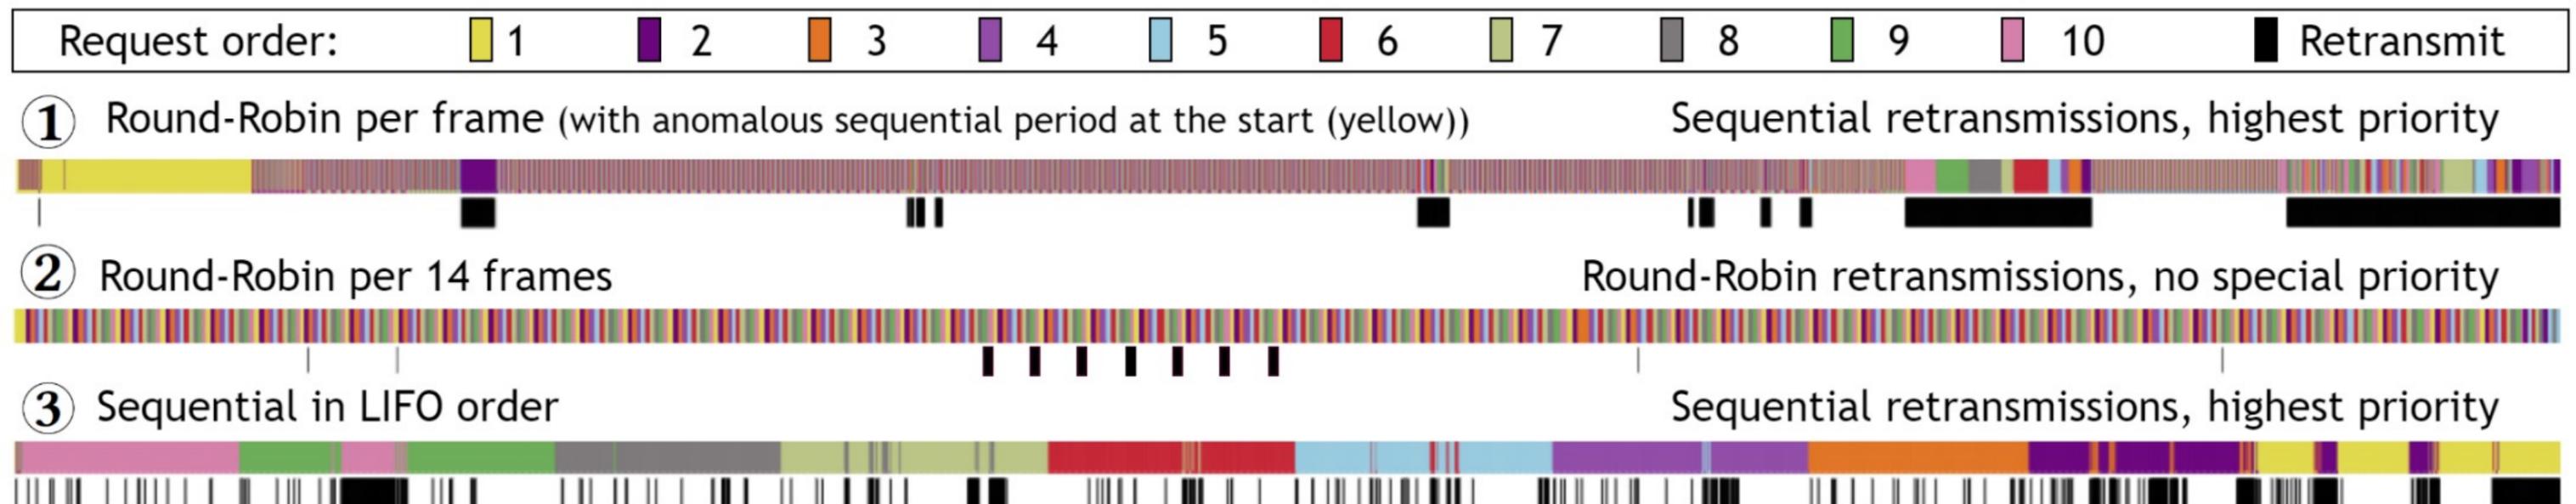

## Observations

- RR schemes show frequent color changes( 1 , 2 )
- Long contiguous swaths( 3 ) mean sequential transfers
- In (3) later streams are interrupted with retransmissions of earlier ones
- (2) interleaves retransmissions with new data
- (1) changes its multiplexing behavior from RR to sequential for lost data

## Abnormalities

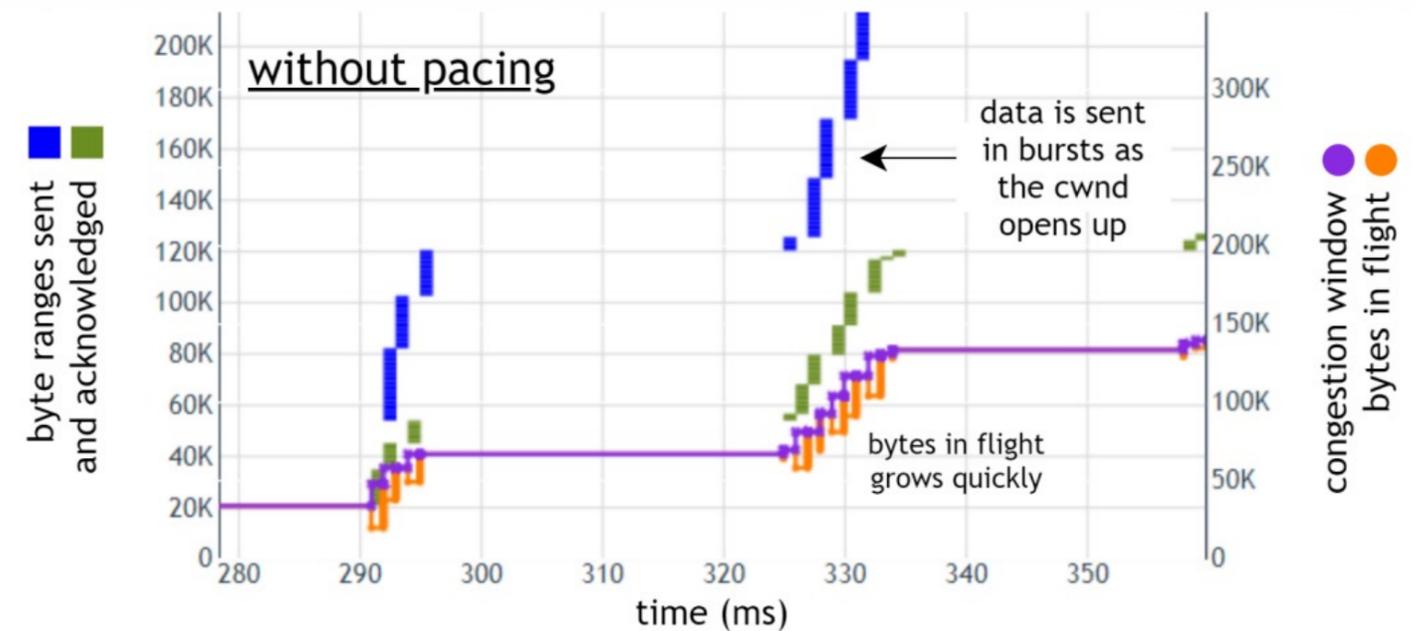

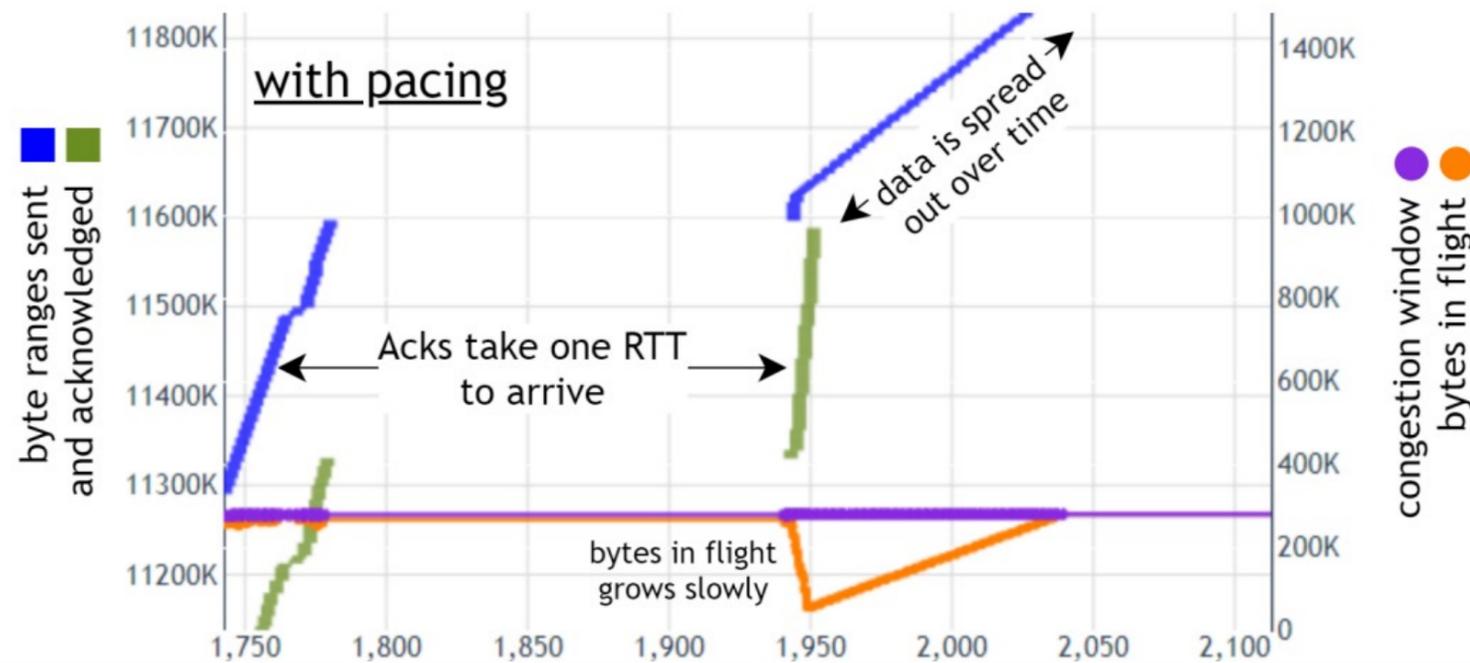

- (1) normally uses RR but has a long sequential period at the start
- (3) unintentionally sent data in Last-In First-Out order, the worst-case for web performance

# Congestion Control (CC)

- ❑ CC is topic of active research which is more open to experimentation in QUIC.
- ❑ Debugging CCs is a major reason for create custom visualizations.
- ❑ qvis suite includes a comprehensive congestion control graph.
- ❑ It plots data sent, acknowledgements received, flow control limits, congestion window, bytes in flight, and employed RTT measurements on a timeline.

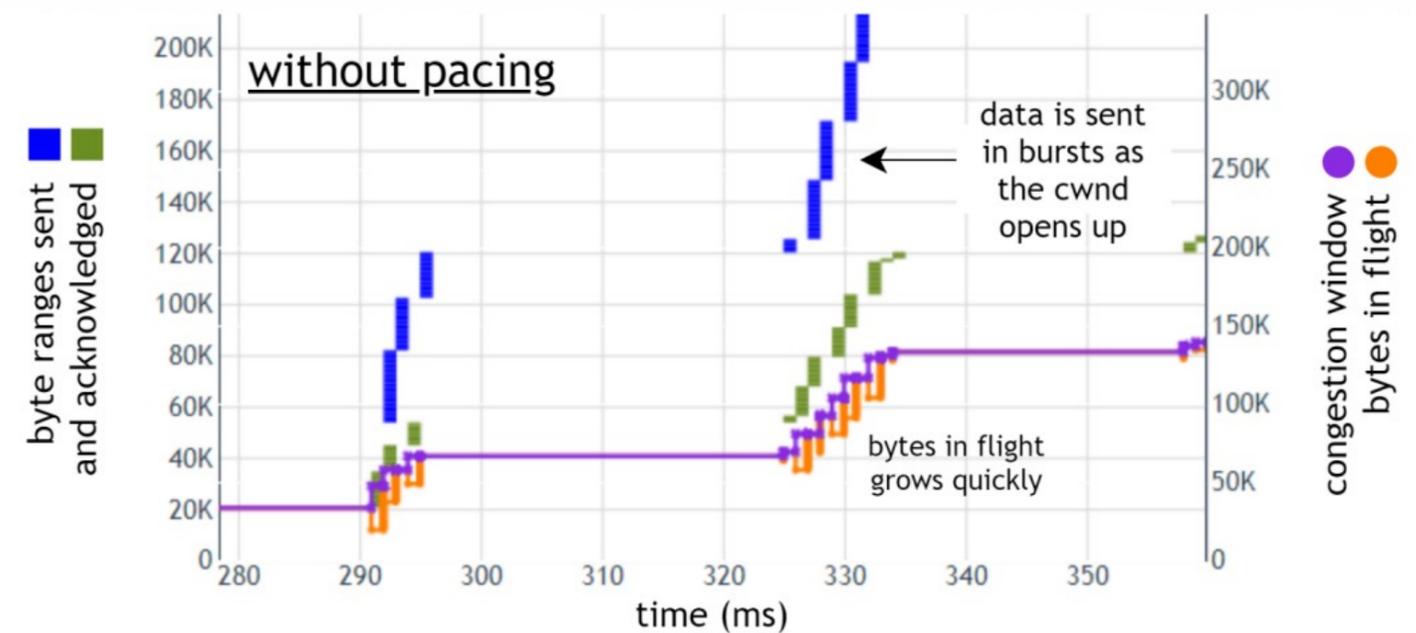

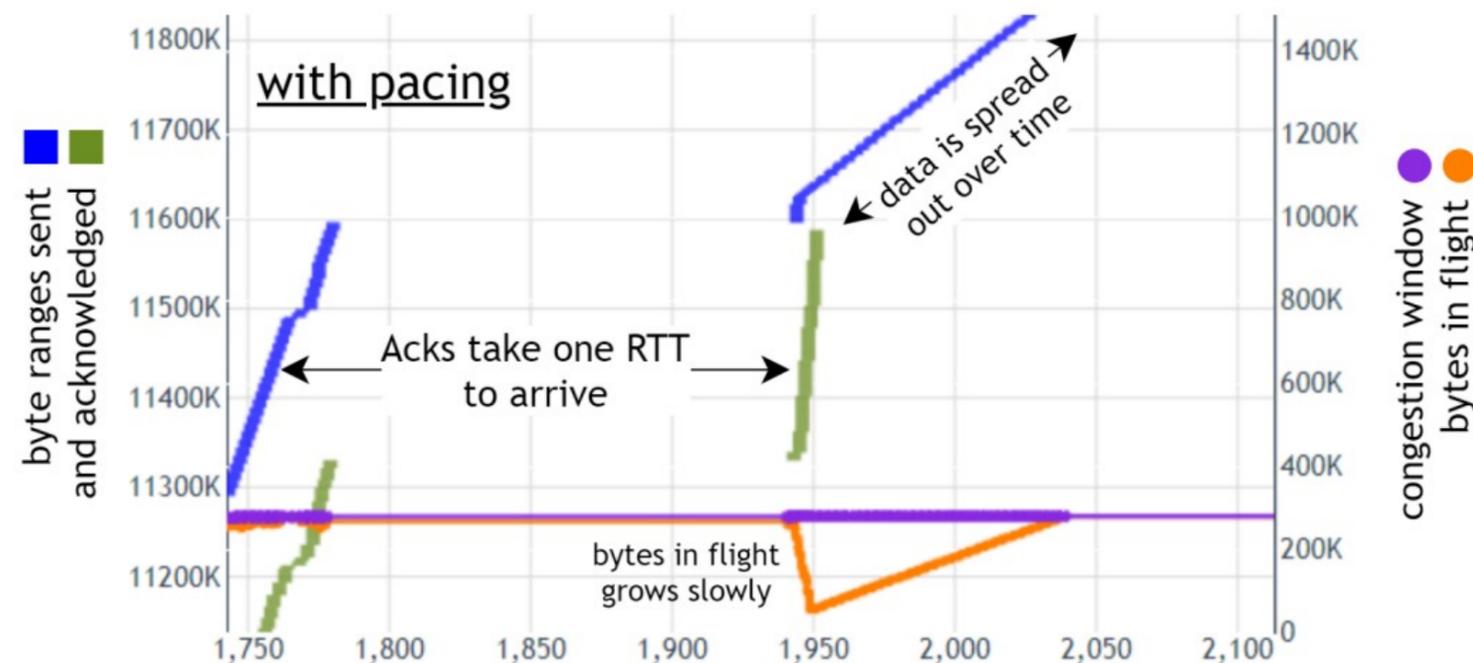

# Congestion Control (CC)

## Observations

- With pacing, the bytes in flight grow slowly over time as data is spread out, while without pacing, it jumps up quickly.
- Pacing is the practice of spreading out packets across an RTT instead of sending them in short bursts, and is thought to reduce packet loss.

# Congestion Control (CC)

OLLSCOIL NA GAILLIMHÉ  
UNIVERSITY OF GALWAY

## □ Practical uses

- Facebook diagnosed their BBR code not entering the probeRTT state at the right time.
- They also identified large-scale pacing issues between their transatlantic data centers due to errors in RTT measurement.
- Cloudflare used qvis to debug their Cubic CC with 'hystart' implementation.
- Bugs were found in QUIC's retransmission logic during its complex handshake.
