Assignment 2: Image Processing & Analysis

# 1 A Morphological Image Processing Pipeline for Medical Images

Figure 1: Original Skin Biopsy Image

## 1.1 Conversion to A Single-Channel Image

```
# Task 1: A Morphological image processing pipeline for medical images
    # Task 1.1: Conversion to a single channel image
    import cv2
    # read in original image (in BGR format)
    image = cv2.imread("../../Task1.jpg")
    # convert to greyscale
    greyscale = cv2.cvtColor(image, cv2.COLOR_BGR2GRAY)
    cv2.imwrite("./output/greyscale.jpg", greyscale)
10
11
    # convert to blue channel only
12
    b_channel = image.copy()
13
    b_{channel[:, :, 1]} = 0
14
    b_channel[:, :, 2] = 0
15
    cv2.imwrite("./output/b_channel.jpg", b_channel)
16
17
    # convert blue channel to greyscale
18
    b_channel_greyscale = cv2.cvtColor(b_channel, cv2.COLOR_BGR2GRAY)
19
    b_channel_greyscale_contrast = b_channel_greyscale.std()
20
    cv2.imwrite("./output/b_channel_greyscale.jpg", b_channel_greyscale)
21
22
    # convert to green channel only
23
    g_channel = image.copy()
24
25
    g_{channel[:, :, 0]} = 0
```

```
g_channel[:, :, 2] = 0
26
    cv2.imwrite("./output/g_channel.jpg", g_channel)
27
28
    # convert green channel to greyscale
29
    g_channel_greyscale = cv2.cvtColor(g_channel, cv2.COLOR_BGR2GRAY)
30
    g_channel_greyscale_contrast = g_channel_greyscale.std()
31
    cv2.imwrite("./output/g_channel_greyscale.jpg", g_channel_greyscale)
32
33
    # convert to red channel only
34
    r_channel = image.copy()
35
    r_{channel[:, :, 0]} = 0
36
    r_{channel[:, :, 1]} = 0
37
    cv2.imwrite("./output/r_channel.jpg", r_channel)
38
39
    # convert red channel to greyscale
40
    r_channel_greyscale = cv2.cvtColor(r_channel, cv2.COLOR_BGR2GRAY)
41
    r_channel_greyscale_contrast = r_channel_greyscale.std()
42
    cv2.imwrite("./output/r_channel_greyscale.jpg", g_channel_greyscale)
43
44
    # assess objectively which allows most contrast
45
    print("Blue Channel Greyscale Contrast: " + str(b_channel_greyscale_contrast))
    print("Green Channel Greyscale Contrast: " + str(g_channel_greyscale_contrast))
47
    print("Red Channel Greyscale Contrast: "
                                                 + str(r_channel_greyscale_contrast))
48
```

Since the image has predominant hues of pink-purple, we would expect the green-channel-only image to be the one that yields the highest contrast, as pink & purple colours are made up primarily by the blue & red channels: the dominance of these channels results in little variance in intensity within these channels, and therefore green will have the highest intensity variance. This is proven true by the text output of the above code, where the standard deviation of the greyscale image based off the green channel alone is by far the highest:

Figure 2: Output of 1\_single\_channel\_conversion.py

My selected single-channel image is the greyscale version of the green-channel-only image, as it yields the greatest contrast:

Figure 11: Selected single-channel image: greyscale green-channel-only

#### 1.2 Image Enhancement

```
# Task 1.2: Image Enhancement
    import cv2
2
3
    # read in chosen single-channel greyscale image
    image = cv2.imread("./output/g_channel_greyscale.jpg", cv2.IMREAD_GRAYSCALE)
5
    # apply histogram equalisation
    equalised_image = cv2.equalizeHist(image)
8
    equalised_image_contrast = equalised_image.std()
    cv2.imwrite("./output/histogram_equalised.jpg", equalised_image)
10
11
    # apply contrast stretching
12
    stretched_image = cv2.normalize(image, None, 0, 255, cv2.NORM_MINMAX)
13
    stretched_image_contrast = stretched_image.std()
14
    cv2.imwrite("./output/contrast_stretched.jpg", stretched_image)
15
16
    print("Histogram Equalisation Contrast: " + str(equalised_image_contrast))
17
    print("Contrast Stretching Contrast: "
                                               + str(stretched_image_contrast))
18
```

Listing 2: 2\_image\_enhancement.py

Figure 12: Output of 2\_image\_enhancement.py

I chose to use the histogram equalisation technique as it gave the best contrast, as seen from the calculated standard deviation in contrast above and in the output images below.

Figure 13: Histogram-equalised image

Figure 14: Contrast-stretched image

## 1.3 Thresholding

2

5

10

11

Listing 3: 3\_thresholding.py

I used Otsu's algorithm to find the optimal threshold value that best separated the foreground (objects of interest) from the background. As can be seen from the above output, the optimal value chosen was 129.

Figure 16: Image with Otsu thresholding

#### 1.4 Noise Removal

Listing 4: 4\_noise\_removal.py

I chose to go with kernel\_size = 25 as it seemed to give the optimal balance between removing noise without significantly reducing the size of the remaining fat globules .

Figure 29: kernel\_size = 25 Figure 30: kernel\_size = 27 Figure 31: kernel\_size = 29 Figure 32: kernel\_size = 31

Figure 33: Chosen noise threshold: kernel\_size = 25

## 1.5 Extraction of Binary Regions of Interest / Connected Components

# 2 Filtering of Images in Spatial & Frequency Domains

Figure 34: Original Facial Image

## 2.1 Spatial Domain

Listing 5: Task 2.1 section of task2.py

After some experimentation, I chose parameter values of kernel\_size = (15,15) and variance = 2 as, in my opinion, these yielded the best balance between blurring imperfections like wrinkles without causing the entire image to become too blurry.

Figure 35: Output of 1\_spatial\_domain.jpg

# 2.2 Frequency Domain Filtering

```
15
    # Task 2.2: Frequency Domain Low-Pass Filter
    gaussian_kernel = cv2.getGaussianKernel(kernel_size[0], variance)
16
    gaussian_kernel_2d = gaussian_kernel @ gaussian_kernel.T
17
    fft_gaussian = np.fft.fft2(gaussian_kernel_2d)
18
19
    # shift zero frequency component to center
20
    fft_gaussian_shifted = np.fft.fftshift(fft_gaussian)
21
22
    # calculate the magnitude spectrum for visualization
23
    magnitude_spectrum = np.log(np.abs(fft_gaussian_shifted) + 1)
24
25
    # Plot the magnitude spectrum (Frequency Domain Representation)
26
    plt.imshow(magnitude_spectrum, cmap='gray')
27
    plt.axis('off')
28
    plt.savefig("./output/2_frequency_domain_low-pass_filter.jpg", bbox_inches='tight', pad_inches=0)
29
```

Listing 6: Task 2.2 section of task2.py

Figure 36: Zero-centered low-pass filter of Gaussian Kernel
